Breaking US Logistics: Defeating the Lilypad strategy /📄

Saudi Arabia's leader MBS complains that his nation is being attacked by Iran even though it isn't directly involved. Even if MBS's statement is true, it doesn't matter.

Let me explain how the US works post-Iraq war. The lily-pad strategy.

The US keeps bases all around the world with plenty of war fighting material. This is a lot like Amazon with its regional facilities. Notice how you can order almost anything and have it arrive at your door stop in just a day? The US does the same thing.

It's like Newton's Cradle. Imagine you have 5 bases spread across 5 nations:

A(merica) - B - C - D - E(mirates)

You're low on ammunition in E. Your home base manufacturing the ammunition and storing it is A. Where do you get your ammunition from? Obviously, you get it from D.

Then, you send out ammunition from A, B or C to D to keep the buffer replenished. This way you seemingly have an infinite amount of resources everywhere simultaneously.

What Iran is doing is destroying D and C, depleting them before they even enter the war. The US seemingly hasn't figured it out because they're still sending jets all the way from A, proving Iran's strategy is winning.

Most people can't see this because they're focused on numerous other aspects of war, but this is what I've been waiting for someone to figure out for a very very long time.

/End

Saudi Arabia's Crown Prince Mohammed bin Salman: Saudi airspace was not used for Israeli or American attacks against Iran; Iranian attacks against Saudi Arabia have no justification.

The Lily-Pad Strategy

BY DAVID VINE

The first thing I saw last month when I walked into the belly of the dark grey C-17 Air Force cargo plane was a void — something missing. A missing left arm, to be exact, severed at the shoulder, temporarily patched and held together. Thick, pale flesh, flecked with bright red at the edges. It looked like meat sliced open. The face and what remained of the rest of the man were obscured by blankets, an American flag quilt, and a jumble of tubes and tape, wires, drip bags, and medical monitors.

That man and two other critically wounded soldiers — one with two stumps where legs had been, the other missing a leg below the thigh — were intubated, unconscious, and lying on stretchers hooked to the walls of the plane that had just landed at Ramstein Air Base in Germany. A tattoo on the soldier's remaining arm read, "DEATH BEFORE DISHONOR."

I asked a member of the Air Force medical team about the casualties they see like these. Many, as with this flight, were coming from Afghanistan, he told me. "A lot from the Horn of Africa," he added. "You don't really hear about that in the media."

"Where in Africa?" I asked. He said he didn't know exactly, but generally from the Horn, often with critical injuries. "A lot out of Djibouti," he added, referring to Camp Lemonnier, the main U.S. military base in Africa, but from "elsewhere" in the region, too.
