Before publishing part 4, I'm going to talk a little bit about science.
Andrew Cote is a typical scientism type person, who thinks experiments is where science ends and beings -- that's not true, it begins with a formulation of a hypothesis. An experiment does not PROVE it! /

https://twitter.com/Andercot/status/1809475065941237833

All an experiment can do is TEST it. Thanks to the advent of dishonest scientists over the last 120 years, beginning with Einstein, people planted the idea that a model that "predicts an experiment" almost "prophetically", MUST be the correct one. That isn't true either.

Models have a number of parameters and these can always be tweaked. In case the number of parameters gets large enough you can always overfit and match the results:
"With four parameters I can fit an elephant, and with five I can make him wiggle his trunk" -- Von Neumann

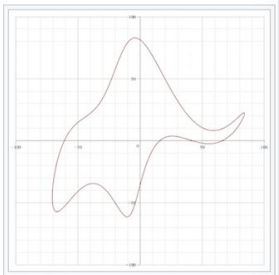
Construction [edit]

The construction is based on complex Fourier analysis.

The curve found in 2010 is parameterized by:

$$\begin{cases} x(t) &= -60\cos(t) &+30\sin(t) &-8\sin(2t) &+10\sin(3t) \\ y(t) &= 50\sin(t) &+18\sin(2t) &-12\cos(3t) &+14\cos(5t) \end{cases}$$

The four fixed parameters used are complex, with affixes $z_1 = 50 - 30i$, $z_2 = 18 + 8i$, $z_3 = 12 - 10i$, $z_4 = -14 - 60i$. The affix point $z_5 = 40 + 20i$ is added to make the eye of the elephant and this value serves as a parameter for the movement of the "trunk".[3]

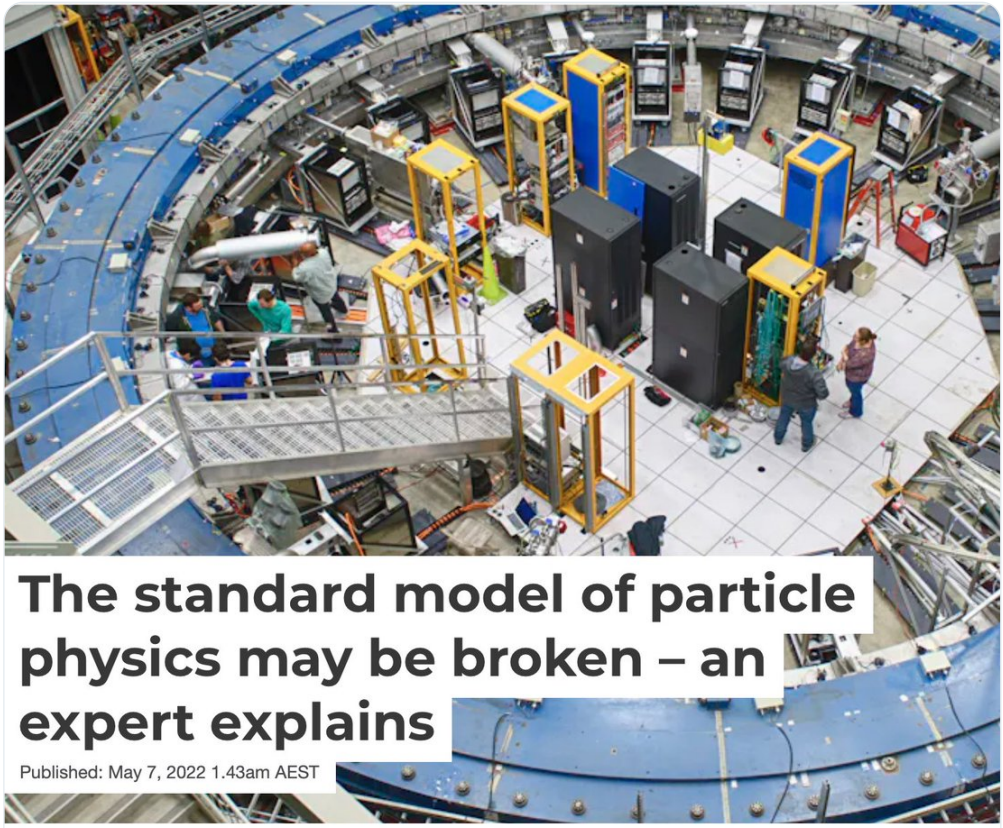


Fermi-Neumann elephant

See also [edit]

This is easy to see in the physical sciences where so many existing theories posit models that need to be modified constantly as new measurements arrive -- see the so-called standard model. It's an absolute joke today.

It's MUCH harder in the field of anthropology however.



The standard model of particle physics may be broken – an expert explains

As a physicist working at the Large Hadron Collider (LHC) at Cern, one of the most frequent questions I am asked is “When are you going to find something?”. Resisting the temptation to sarcastically reply “Aside from the Higgs boson, which won the Nobel Prize, and a whole slew of new composite particles?”, I

No one can measure exactly how much is "imagined" and what is actually demonstrated.
But I'm going to do it, today, on the 7th of July, 2024.
I will break Anthropology by attacking its root, its centre of gravity.
For those who can see and read, you will know for sure it's a lie!

So keep in mind this one logical truth:
It only takes ONE counter-example to disprove a scientific theorem. This is not to say a generalisation -- in there the exceptions prove the rule. But no, a fundamental assumption can be broken by ONE counter-example.

Prepare thyself. /End
