Creatio Ex Nihilo is a doctrine almost all religions adopt today. But it's not what it appears to be. /📄

Aristotle did not even bother to explain why it wasn't true. It was a priori assumption no one questioned, the universe always existed, there was no time zero. It also had infinite expanse.

What happened? Why is this universal idea now rejected without even being considered?

Today we see structures in the universe that necessitate us to give up on this idea of a time zero, infinite currents flowing everywhere. The James Webb space telescope has already defeated the CMBR/Big Bungus model that was created by a ret*rded Jesuit priest (Georges Lemaitre) to argue against the quasi-steady state theory which was becoming popular.

Today hardened theologists will outright stop speaking to you the moment you question the idea of Creatio Ex Nihilo, it is so deeply embedded within their theology that they'd have to trash most of it and start from scratch (just like Paul warned them in Corinthians 3:10-11).

It's quite ironic when you look at other fields, actually. These same people are gradually going in the opposite way, trying to integrate falsehoods (evolution) into their theology, which ultimately stem from the same falsehood -- that something can come out of nothing without a divine intervention that arrives to us from outside this created-as-a-whole universe. The most transcendental form of creation is that which has no beginning or end, but is both its own beginning and end.

/End

RETHINKING THE COSMOS

The discovery of the Quipu Superstructure challenges our understanding of how the universe forms and evolves—demanding a serious rethink of cosmic structure growth in current models.
