Oppenheimer was NOT the father of the nuclear bomb.
He was the director and a libellous scoundrel who accused people of being communists randomly.

The man who first conceived the nuclear chain reaction (though it was a obvious matter once fission was discovered) was Leo Szilard.

The director of the Manhattan project*.
He would have been fired for his behaviour if it wasn't for the on-going war.

He later targeted his own brilliant student and forced him to flee the United States.
Unlike Oppenheimer, Leo Szilard was a good man and a fun person.
Despite conceiving of the nuclear bomb, his primary concern was to stop it from becoming a reality -- he only broadcast his work the moment he heard Neils Bohr was also working on it.

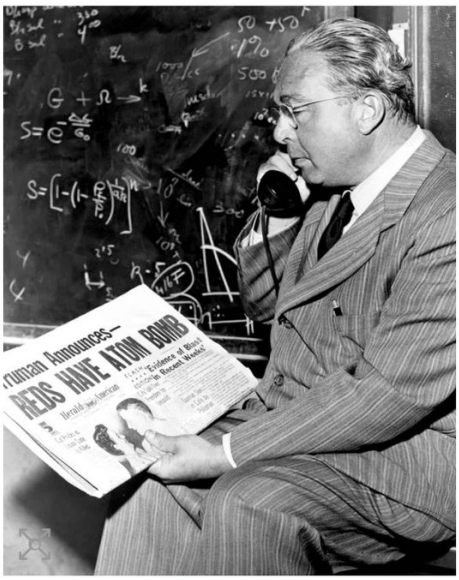
Leo Szilard: the physicist who envisaged nuclear weapons but later opposed their use

24 Jan 2023

Born 125 years ago, the Hungarian–American physicist Leo Szilard is best remembered for being the first scientist to call for atomic bombs to be developed – before later demanding they be stopped. But as Istvan Hargittai explains, this was not the only occasion when his views evolved in unexpected directions

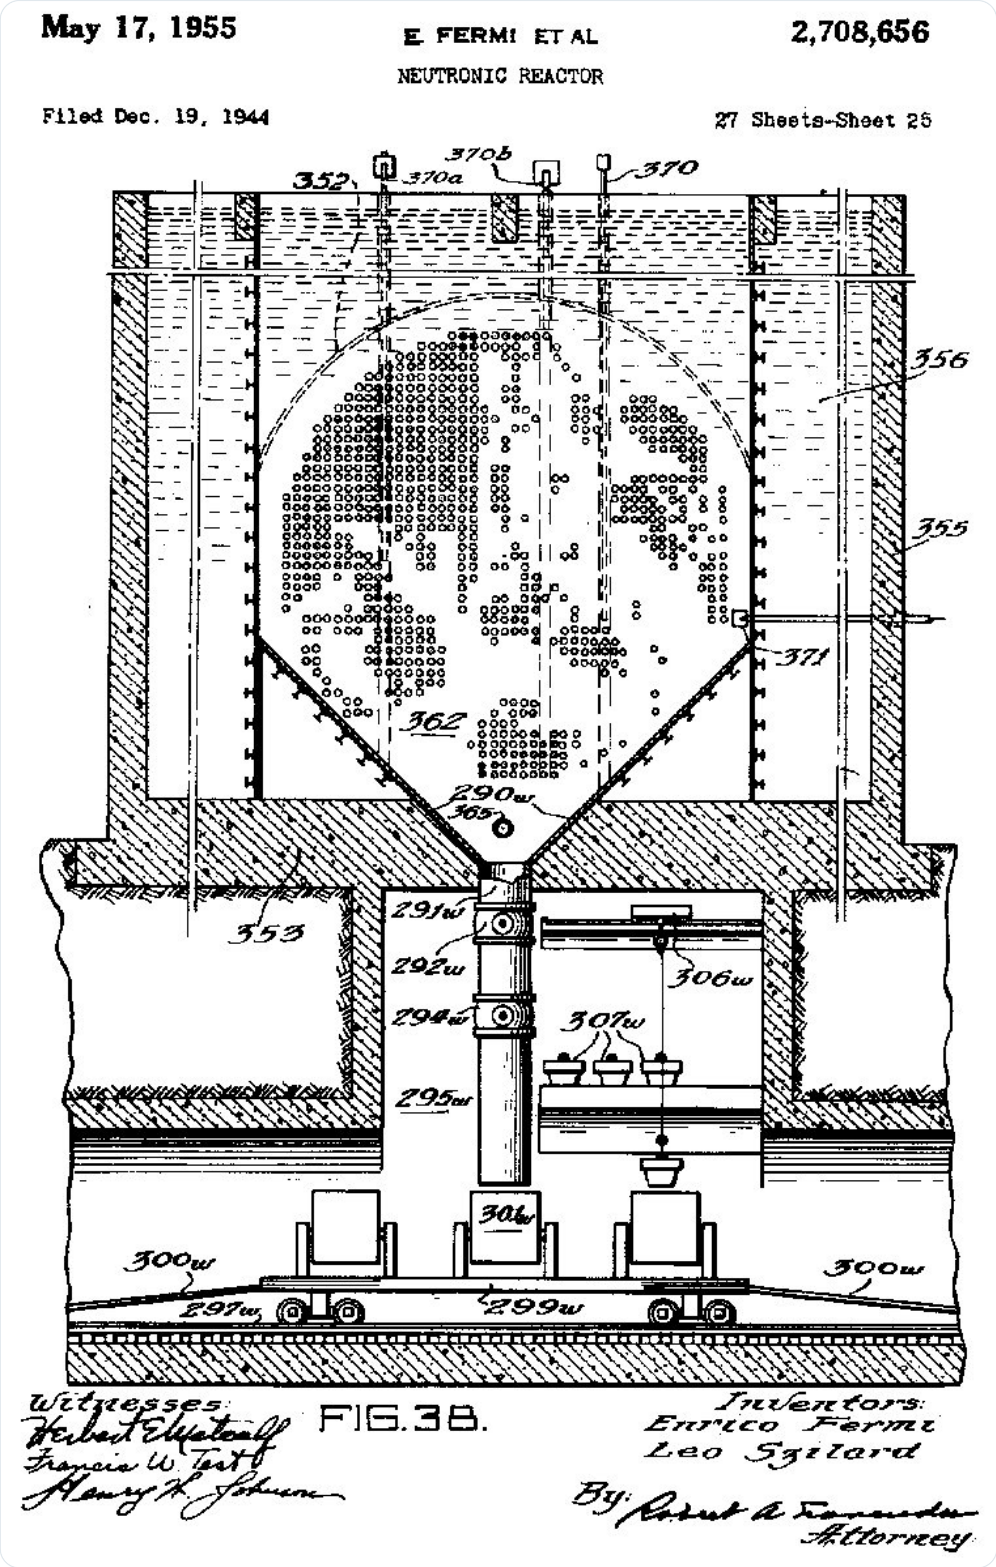


Safety in numbers Photographed after the Soviet Union exploded its first atomic (fission) bomb in 1949, Leo Szilard believed that peace

One day in September 1933, Leo Szilard was walking along Southampton Row in London, musing about an article he had just read in *The Times*. It had reported a speech given by Ernest Rutherford, who had rejected the idea of using atomic energy for practical purposes. Anyone who was looking for a source of power from the transformation of atoms, Rutherford had famously said, was talking "moonshine".

As he waited at a set of traffic lights at Russell Square, a terrible thought suddenly struck Szilard. If a chemical element were to be bombarded with neutrons, a nucleus could absorb a neutron, split into smaller parts and emit two neutrons in the process.

So with little more to say for now, from the bottom of my heart, though decades late, rest in peace my marslakók brother, Leo Szilard.
I hope your dreams of a planet in peace that can harness the power of nuclear reactions are realised and we avoid the worst case scenario. /End



P.S. he not only invented the nuclear bomb, but alongside Enrico Fermi, invented the nuclear reactor.
