The biggest lie of all is the idea that Sol is not a chaotic electromagnetic system that has a large external driver.

Plasmas aren't just hot gasses, they're necessarily ionised. Why is the atmosphere of the sun much hotter than its surface? We know nothing about the core. /🧵

Why do we see stars disappearing and appearing all over the universe. Do we even have a gravity model of this that isn't a "black hole" clown show? (No). Even a plasma model is out of our reach for now.
Why are we so sure Betelgeuse is about to "blow"?

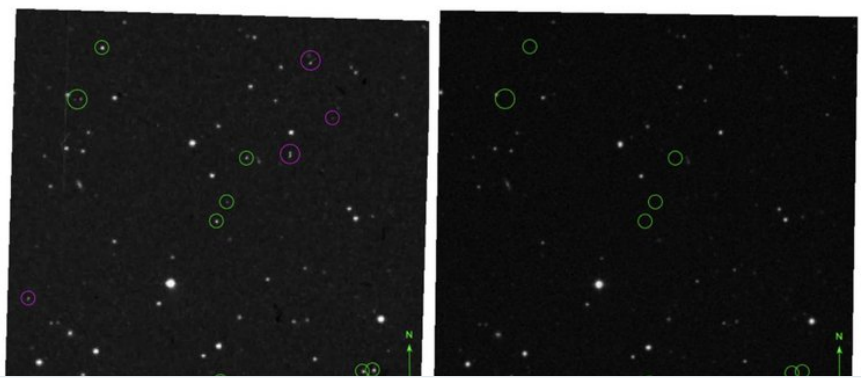
Astronomers Find a Group of Appearing and Disappearing Stars

An international collaboration of astronomers has identified a curious occurrence of nine stars like objects that appeared and vanished in a small region within half an hour in an old photographic plate.

Astronomers collaborating across counties track vanishing and appearing celestial objects by comparing old images of the night sky with new modern one, register unnatural phenomena, and probe deep into such phenomena to record changes in the Universe.

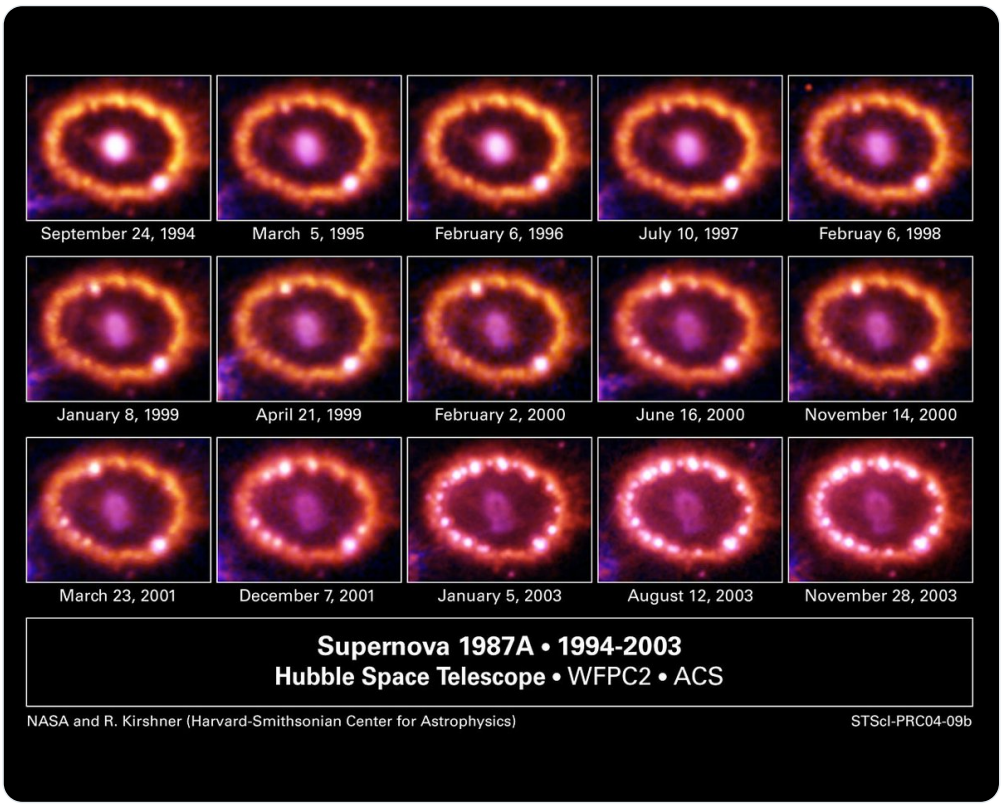
Scientists from Sweden, Spain, USA, Ukraine, and India, including Dr. Alok C. Gupta, Scientist from ARIES, investigated early form of photography that used glass plates to capture images of the night sky from the 12th of April 1950, exposed at Palomar Observatory in California, USA and detected these transient stars which were not to be found in photographs half an hour later and not traced since then. Such a group of objects appearing and disappearing at the same time have been detected for the first time in the history of astronomy.

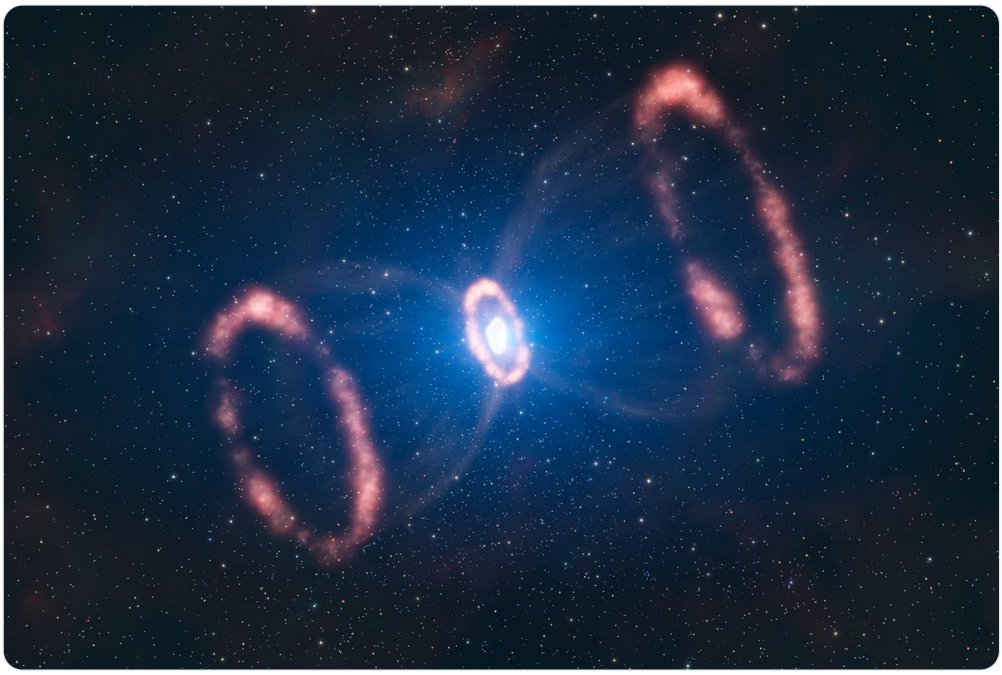
The astronomers have not found any explanation in well-established astrophysical phenomena like gravitational lensing, fast radio bursts, or any variable star that could be responsible for this cluster of fast changes in the sky.



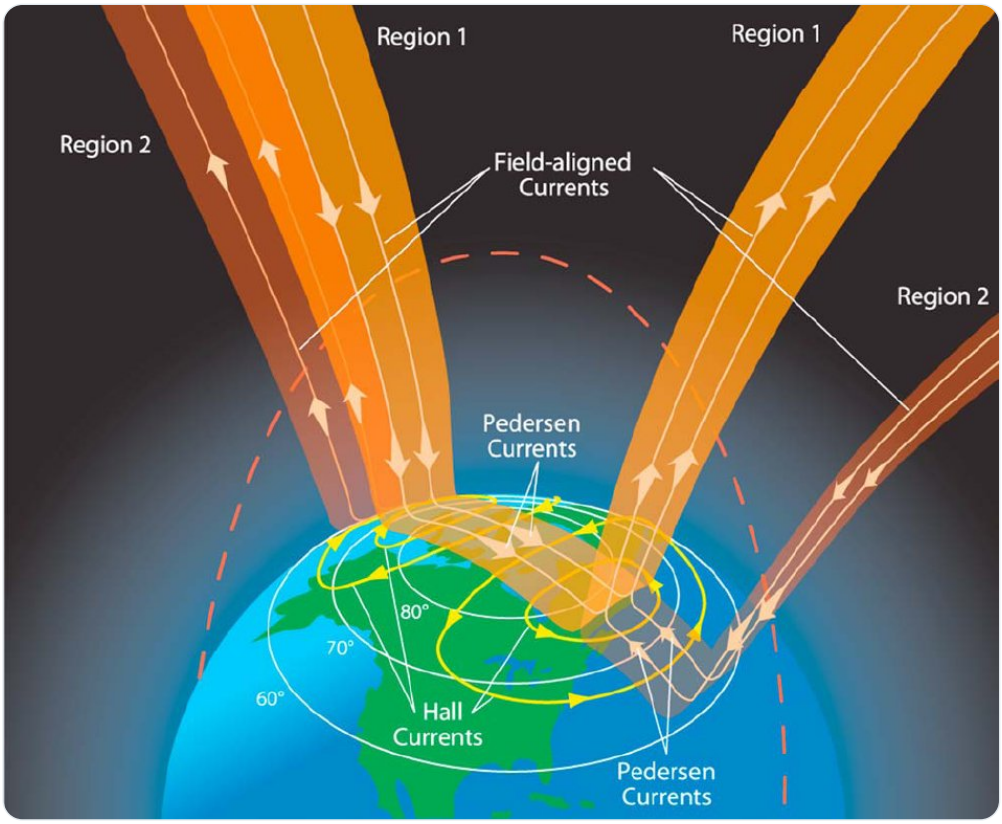
Are "supernovas" deaths of stars or a birth of new stars?
Can z-pinches form and even power stars?
Is the clown-tier "dark matter/dark energy" just Birkeland currents flowing across the entire universe?

Have our ancient ancestors witnessed this event up close to us? What's with this ring pattern?

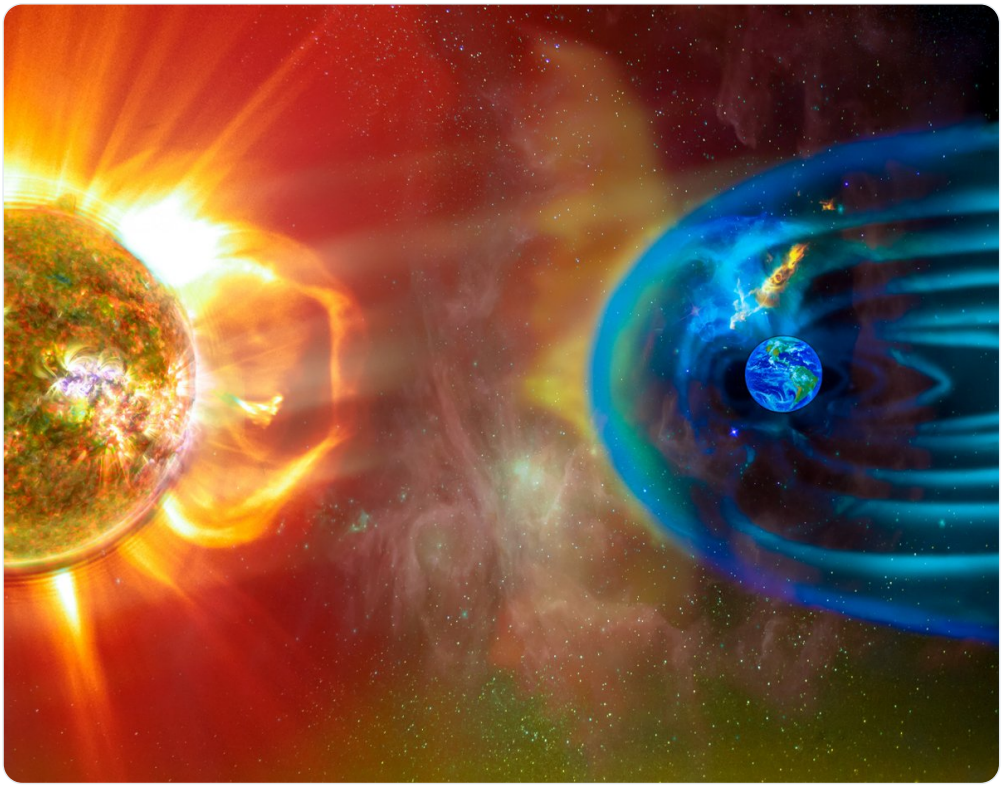




What happens when an event, or even a smaller one like this, happens really close to our suddenly weakening magnetic field. What can possible cause the magnetic field of our planet to flip from the perspective of the crust?
What if the field turns off altogether inbetween?



What happens when our plasmasphere can no longer shield us from the incoming plasma bursts... will they reach the ground? What happens to those below? What if the potential 10s or more billion metric tons aren't just diffused but come down as filaments?



Scientists Discover Impenetrable Barrier 11,500 km above Earth

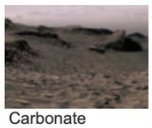
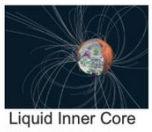
Many of Titan's Rivers Do Not End in Deltas, New Study Finds

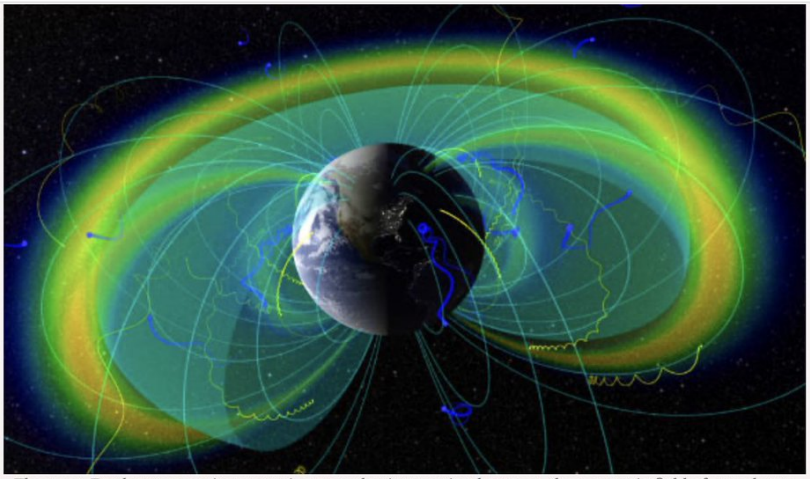


Carbonate Minerals Found by Curiosity Indicate Carbon Cycle Operated on Early Mars



Liquid Inner Core Could Explain Mars' One-Sided Magnetic Field

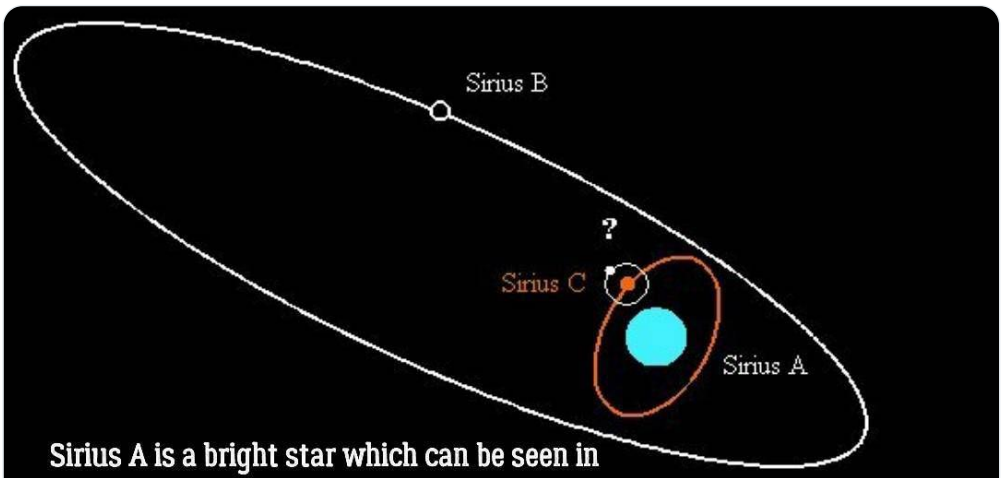
A group of researchers headed by Prof Daniel Baker of the University of Colorado's Laboratory for Atmospheric and Space Physics has discovered a nearly impenetrable barrier some 11,500 km above our planet that blocks so-called 'killer electrons,' which can fry satellites and degrade space systems during intense solar storms.



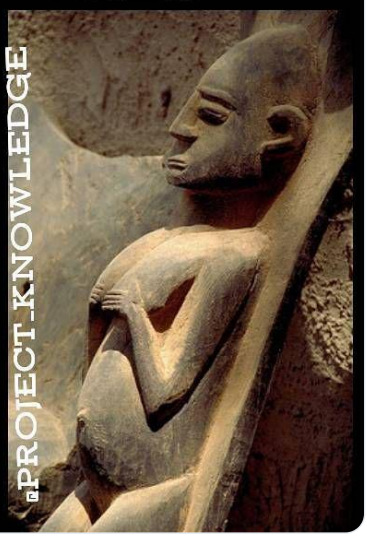
The near-Earth space environment is a complex interaction between the magnetic field of our planet, cool plasma moving up from its ionosphere, and hotter plasma coming in from the solar wind; these interactions combine to maintain the radiation belts around Earth. Plasma interactions can generate sharply delineated regions in these belts. In addition to the inner and outer radiation belts, the cooler plasma of the plasmasphere interacts so that it keeps out the higher-energy electrons from outside its boundary, called the plasmapause. The radiation belts (rainbow-color) and plasmapause (blue-green surface) surround Earth, its structure largely determined by Earth's dipole magnetic field (represented by cyan curved lines). The radiation belt is sliced open, simultaneously revealing representative confined charged particles spiraling around the magnetic field structure. Yellow particles represent negative-charged electrons, blue particles represent positive-charged ions. However, if realistically scaled for

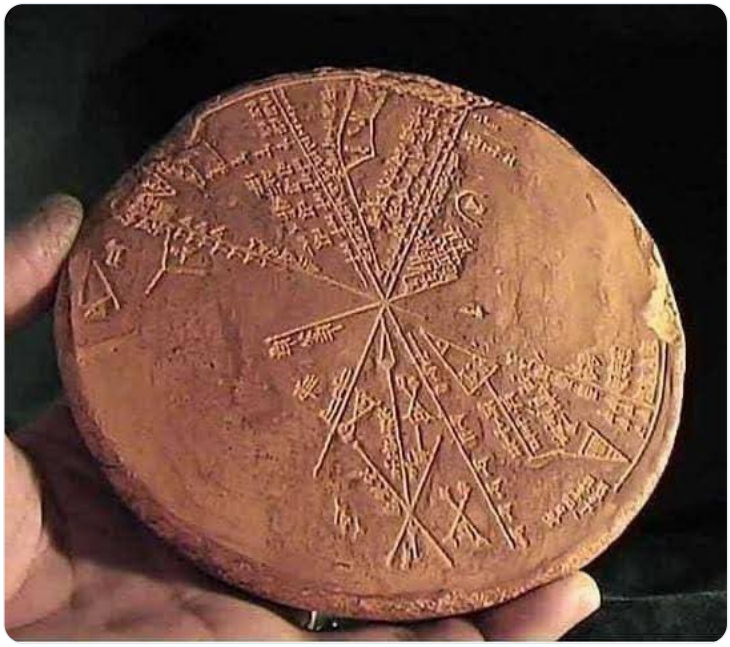
Why were ancient people obsessed with time keeping, and why is there one final tribe counting down using the binary stars orbiting each other (Sirius A + B) as some kind of countdown clock?

Why was our most ancient memory left by our ancestors a star mnemonic known as the zodiac?



Sirius A is a bright star which can be seen in the western sky through the naked eye, but not Sirius B its invisible companion.
The Dogon people knew that Sirius B was very small but very dense or heavy. Yet its existence was proven only in 1970 when it was photographed for the first time by Western astronomers. The Dogon tribe knew about the existence of this invisible star for thousands of years.
They also knew that Saturn has four moons, and has rings or halos around it, although these cannot be seen without powerful telescopes.





You can easily dismiss all of this and return to the black hole laden, dark energy/dark matter shibboleth, you can ignore periodic cataclysms we have detected, including one that destroyed 85% of the life in the ocean (Late Ordovician mass extinction).
You can take their geological timing seriously, if you wanted to and dismiss them as unlikely in our time...

Earth has experienced periodic cataclysms throughout its history, **primarily driven by mass extinction events linked to rapid and dramatic changes in climate and environmental conditions**. These events, including the "Big Five" mass extinctions, have seen significant drops in species diversity due to factors like climate change, ocean acidification, and volcanic activity. While the precise triggers of these events are still debated, evidence suggests that

I dismissed it all too, due to the heavy amount of priors I held from my education. But over time the contradictions were too heavy to bear. The correlations between what should be isolated cultures impossible to ignore.

Why was everyone convinced the sun was red?

A few last questions for the most curious minds...

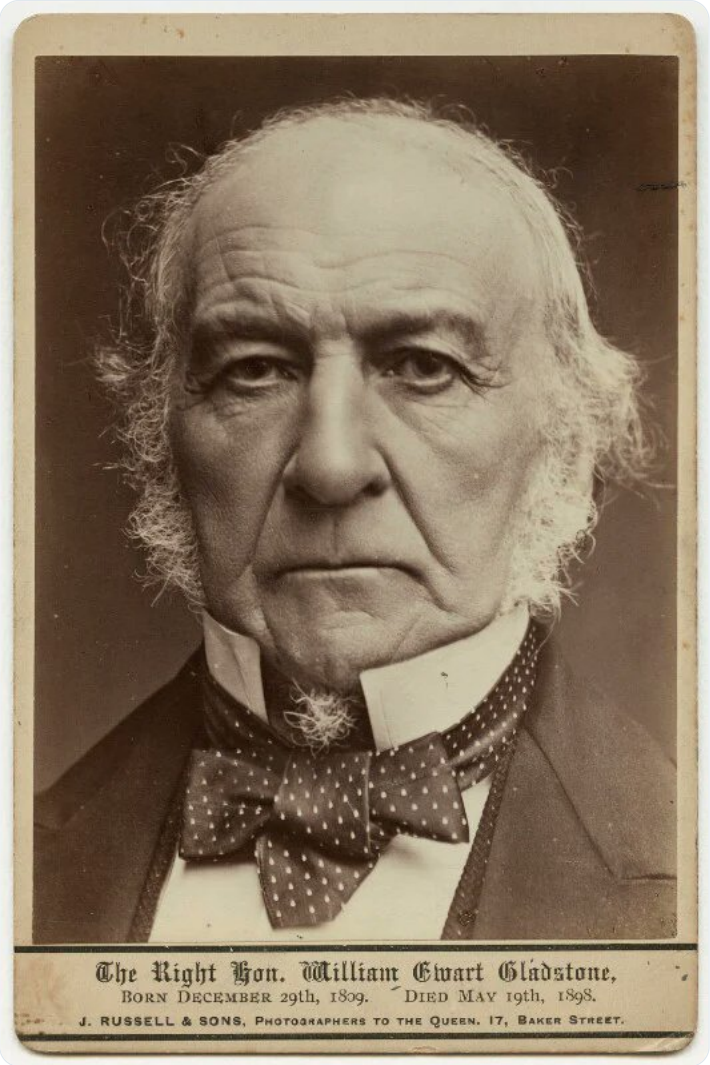
Why did so many cultures use red ochre and other pigments to paint their skin?
What did this Egyptian prayer mean: "Oh Isis, protect me from all things evil and red."?

Why did so many cultures depict demons as red?
And...

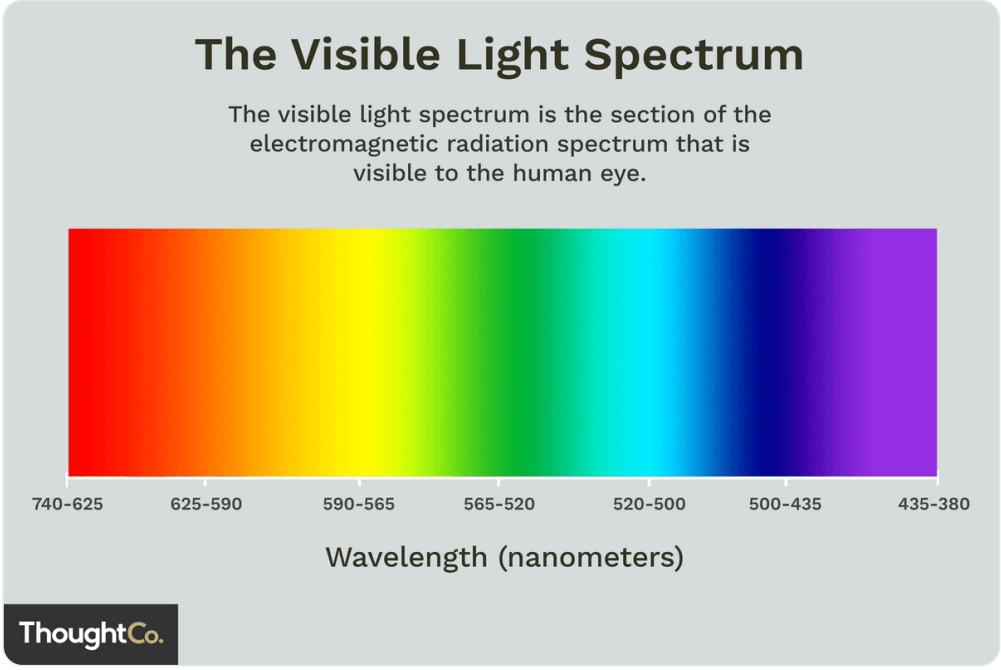
What's with the strange names of these important bodies of water? Black sea, red sea, yellow river...

Why is it that when former British prime minister William Ewart Gladstone studied one of our ancient surviving texts, Homer's epic, did he find the complete absense of the colour blue and only a hint of the color green? Why did Lazarus Geiger discover the same pattern in all other cultures?

Why is it in all culture the colour green and then blue are seemingly "added" to the vocabulary one after the other and only later than red?



C. D. Forsyth
1852.
Druck von Henry & Cohen in Bonn



Did Sol (?) have a different colour back then?
Is it changing now? Why do so many people remember the sun being "yellower?" Why did we all depict it as yellow as children, even the media? Why is it so white now, lol.

What's with this hilarious headline?...

I can go on and on, but I'll leave it there with more questions than answers as usual. Have a bright and beautiful day oomfies.
